

Best Practices

REALice®

Avoid trickle-filling ice resurfacer - minimum static pressure 45 psi.

Ensure blade is sharp and changed regularly.

Shave ice with each flood. Build early-morning dry-shave into routine.

Drive slowly to clean ice: NHL: 8-10 minutes, Olympic: 10-12 minutes.

Reset brine temperature from 2-5°F with gradual 1°F increments.

If indoor temperature in arena falls below freezing, use REALice-treated tempered water.

Use REALice hand-held for building ice, spot-maintenance and repairs.

REALice-treated water never needs to be dumped: it will last for the next flood – even overnight.

REALice water and normal water cannot be mixed: Don't bypass the system.
